

# CHAIR-SIDE REFERENCE: PANRETINAL PIGMENTARY INHERITED RETINAL DEGENERATIONS

## INHERITED RETINAL DEGENERATIONS (IRD)

Inherited retinal degenerations (IRDs) encompass a large group of clinically and genetically heterogeneous diseases that can lead to progressive vision loss. As such, there are a number of different methods utilised to group them into categories. This chairside reference is specific to panretinal dystrophies which are associated with pigmentary changes. A common symptom of these conditions is nyctalopia and associated visual field constriction.

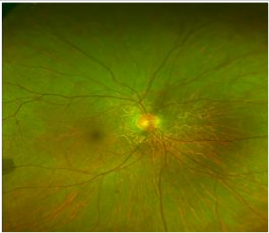

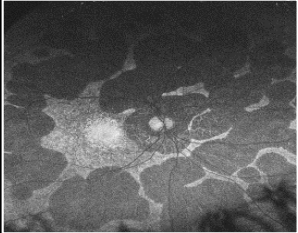

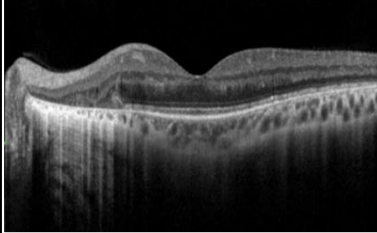

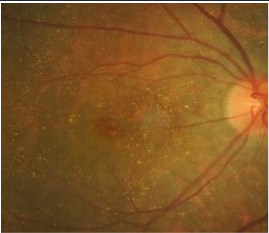

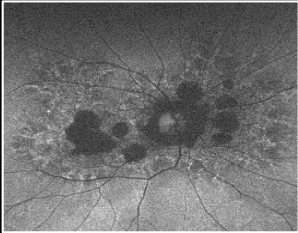

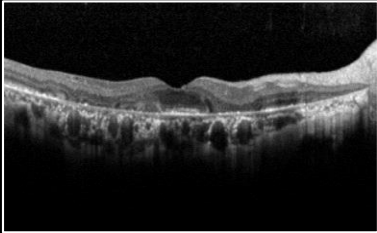

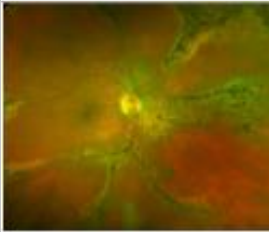

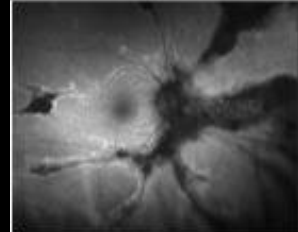

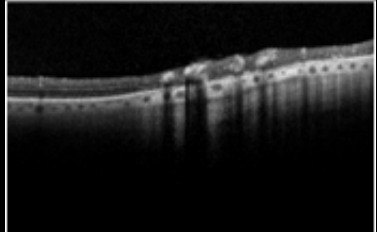

## DIFFERENTIAL DIAGNOSIS OF PAN-RETINAL INHERITED DYSTROPHIES

Retinal image	Fundus Autofluorescence	OCT	Description
<b>Retinitis pigmentosa (Rod-Cone Dystrophy)</b>			
			<ul style="list-style-type: none"> <li>The most common inherited retinal disorder characterised by diffuse progressive photoreceptor degeneration (predominantly rods followed by cones) and RPE.</li> <li><b>Symptoms:</b> nyctalopia with variable timing of onset</li> <li><b>Fundus appearance:</b> Bone-spicule pigmentation in mid-peripheral retina, attenuation of retinal vessels, waxy pallor of the optic nerve head. Retinal changes are evident in established cases with changes often subtle in early disease.</li> <li><b>FAF:</b> Hypo-AF in areas of pigmentation, hyper-AF ring around the macula</li> <li><b>OCT:</b> Disorganisation of outer retina layers (EZ, ELM, ONL) and RPE. Outer retinal tubulations (hyper-reflective round structures with hypo-reflective lumen) may be seen in late-stage disease.</li> <li><b>Other:</b> ERM, macular oedema, posterior subcapsular cataract</li> </ul>
<b>Fundus Albipunctatus</b>			
	<i>Image not available</i>		<ul style="list-style-type: none"> <li>A form of congenital stationary night blindness</li> <li><b>Symptoms:</b> night blindness, restricted peripheral visual field</li> <li><b>Fundus appearance:</b> numerous small whitish-yellow spots scattered in the midperiphery and perfovea.</li> <li><b>FAF:</b> grainier appearance than do normal retinas, no hyper-FAF spots correlated to the albipunctate spots funduscopically</li> <li><b>OCT:</b> hyperreflective lesions at the level of RPE extending into EZ and ELM with focal thinning of ONL</li> <li><b>Prognosis:</b> generally stable or minimally progressive</li> </ul>
<b>Choroideraemia</b>			
			<ul style="list-style-type: none"> <li>A choroiretinal dystrophy characterised by the diffuse, progressive degeneration of the photoreceptors, RPE and choriocapillaris.</li> <li><b>Symptoms:</b> nyctalopia in the first decade of life</li> <li><b>Fundus:</b> RPE degeneration leads increased visibility of choroidal vessels and sclera as well as pigment clumping.</li> <li><b>FAF:</b> Reduced background autofluorescence (AF) with isolated "islands" of relatively normal AF</li> <li><b>OCT:</b> Pigment clumps visible as hyper-reflective deposits. Outer retinal tubulations in advanced disease. Thinning and loss of outer retina, choriocapillaris and choroid.</li> </ul>

# CHAIR-SIDE REFERENCE: INHERITED RETINAL DEGENERATIONS

Centre for Eye Health

Retinal image	Fundus Autofluorescence	OCT	Description
<b>Gyrate Atrophy</b>   			<ul style="list-style-type: none"> <li>A rare retinal dystrophy characterised by progressive chorioretinal degeneration, early cataract formation and myopia</li> <li><b>Symptoms:</b> Nyctalopia occurs in the first decade of life.</li> <li><b>Fundus appearance:</b> Large peripheral areas of chorioretinal atrophy that coalesce over time forming a scalloped border peripherally.</li> <li><b>FAF:</b> Areas of chorioretinal atrophy are hypo-AF. FAF imaging shows the extent of chorioretinal atrophy much more clearly than retinal imaging.</li> <li><b>OCT:</b> Atrophy of the outer retina and RPE. Intraretinal cystoid oedema and/or outer retinal tubulations may be present.</li> </ul>
<b>Bietti Crystalline Corneoretinal Dystrophy</b>   			<ul style="list-style-type: none"> <li>A rare dystrophy characterised by presence of crystalline deposits, RPE degeneration and choroidal vessel sclerosis</li> <li><b>Symptoms:</b> reduced vision, night blindness, visual field loss typically from 2nd decade of life</li> <li><b>Fundus appearance:</b> Multiple, refractive crystals in the retina with associated RPE and choriocapillaris atrophy</li> <li><b>FAF:</b> Areas of chorioretinal atrophy are hypo-AF.</li> <li><b>OCT:</b> The crystalline deposits appear as hyperreflective dots within the retinal layers. Retinal and choroidal architecture is disrupted. Outer retinal tubulation often present.</li> <li><b>Other:</b> Crystalline deposits in the peripheral cornea. CNV and/or macular oedema are complications of this condition.</li> </ul>
<b>DIFFERENTIAL DIAGNOSIS</b>			
<b>Pigmented paravenous chorioretinal atrophy</b>   			<ul style="list-style-type: none"> <li>A rare disorder of unknown aetiology, characterised by pigment accumulation along the distribution of retinal veins. Typically non-progressive and has minimal effect on vision.</li> <li><b>Fundus:</b> Pigmentation and associated chorioretinal atrophy along retinal veins.</li> <li><b>FAF:</b> Linear areas of hypo-AF along the large retinal veins, often surrounded by an area of hyper-AF</li> <li><b>OCT:</b> Thinning of the outer retina layers and disorganisation of the RPE-choriocapillaris complex. Hyper-reflective intra-retinal plaques with posterior shadowing, corresponding to pigmentary changes.</li> </ul>

**CFEH TELEHEALTH**  
SUPPORTING OPTOMETRISTS

This reference is based on the current literature and evidence at the time of writing. This reference is designed a guide to aid diagnosis however individual cases must be assessed in the context of all available clinical data. If you need additional advice or guidance, consider making a free telehealth appointment with a senior CFEH optometrist.
