

# CHAIR-SIDE REFERENCE: VISUAL FIELD DEFECTS

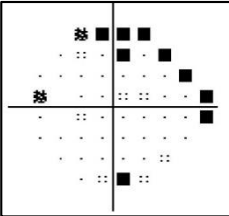

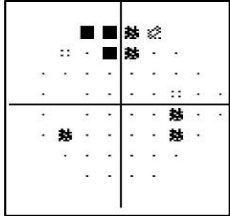

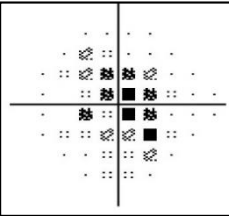

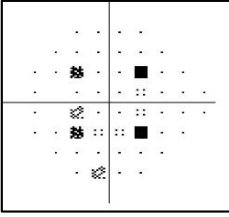

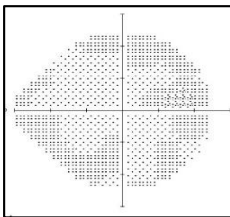

Centre for Eye Health

Many ocular and neurological diseases and conditions are known to exhibit distinct visual field loss patterns, and thus, visual field testing may assist in the differential diagnosis process. The ability to map the depth, extent and change of visual field defects should be considered in clinical management decisions. Some common types of visual field defects and their more common differentials are outlined below. Results must be interpreted critically (reliability and repeatability) and in conjunction with other clinical signs, symptoms and examination findings.

VERTICAL FIELD LOSS PATTERN	CENTROCAECAL	NASAL STEP
<p>Vertically oriented field defects should always raise the suspicion of pathologies on the visual pathway beyond the retina, particularly if it respects the vertical midline. Differentials:</p> <p><b>Unilateral:</b></p> <ol style="list-style-type: none"> <li>1. Retinal disease</li> <li>2. Pre-chiasmal or anterior chiasmal lesion (e.g. compressive lesions)</li> </ol> <p><b>Bilateral (homonymous):</b></p> <ol style="list-style-type: none"> <li>1. Post-chiasmal lesion (e.g. compressive lesions, stroke, injuries)</li> </ol> <p><b>Bilateral (bitemporal/binasal):</b></p> <ol style="list-style-type: none"> <li>1. Chiasmal lesions (pituitary adenoma, meningioma, parasellar carotid artery aneurysm, meningioma, craniopharyngioma, glioma)</li> <li>2. Tilted disc syndrome</li> </ol>	<p><b>Description:</b> Field loss extending from blindspot to fixation. Must include fixation and does not obey horizontal midline. Usually due to damage of the papillomacular bundle.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Optic neuritis</li> <li>• NAION/AION</li> <li>• Cilioretinal artery occlusion</li> <li>• Macular disease</li> <li>• Retinal disease</li> </ul>	<p><b>Description:</b> Field loss respecting the nasal horizontal midline with at least 1 abnormal point outside 15°. No more than 1 point may be on the temporal side.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Glaucoma</li> <li>• Chronic papilloedema</li> <li>• ONH drusen</li> <li>• Optic neuritis</li> <li>• High myopia</li> <li>• Retinal disease</li> </ul>
<p><b>Vertical field loss patterns</b></p>  <p><b>A. Vertical Step:</b> Generally respects the vertical midline with at least 2 points outside 15° of fixation.</p> <p><b>B. Quadrantonopia:</b> Visual field loss that respects both the vertical and horizontal midline. Suggestive of neurological involvement if bilateral. All points within the quadrant must be P&lt;5%.</p> <p><i>Note: Pituitary gland adenoma gives more superior defects ("pie-in-the-sky") while parasellar lesions give more inferior losses ("pie-on-the-floor").</i></p> <p><b>C. Hemianopia:</b> Loss of the vertical hemifield respecting the vertical midline either partially or completely.</p> <p><i>Note: Monocular temporal hemianopia may occur if the lesion is more anterior and only affecting the nasal crossing fibres from the ipsilateral eye.</i></p> <p><b>D. Three Quadrants:</b> Three quadrants with all points at least P&lt;5%. Partial three quadrant losses does not have all points P&lt;5% but is greater than a complete hemianopia.</p> <p><i>Note: Multiple lesions or pathologies may need to be considered.</i></p>	<p><b>ALTITUDINAL</b></p> <p><b>Description:</b> Field loss that respects the horizontal midline.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• BRAO/BRVO</li> <li>• NAION/AION</li> <li>• Retinal disease</li> <li>• Cortical disease (if bilateral, rare)</li> <li>• Advanced glaucoma</li> </ul>	<p><b>TEMPORAL WEDGE</b></p> <p><b>Description:</b> Small visual field defect temporal to blind spot.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Optic neuritis</li> <li>• Glaucoma (rare)</li> <li>• Retinal disease</li> </ul>
	<p><b>ARCUATE</b></p> <p><b>Description:</b> Field loss extending from the blind spot to the nasal field with at least one point outside 15° nasally and at least one abnormal point temporally.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Glaucoma</li> <li>• Chronic papilloedema</li> <li>• ONH drusen</li> <li>• Optic neuritis</li> <li>• High myopia</li> <li>• BRVO/BRAO</li> <li>• Retinal disease</li> </ul>	<p><b>PARACENTRAL</b></p> <p><b>Description:</b> A small visual field abnormality not contiguous to the blind spot, within 15° of fixation, obeying the horizontal midline.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Glaucoma</li> <li>• Chronic papilloedema</li> <li>• ONH drusen</li> <li>• Optic neuritis</li> <li>• High myopia</li> </ul>
	<p><b>ENLARGED BLIND SPOT</b></p> <p><b>Description:</b> Visual field loss involving at least two points contiguous to the blind spot.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Early papilloedema</li> <li>• Glaucoma (rare)</li> <li>• Large PPA</li> <li>• ONH drusen</li> <li>• Tilted disc syndrome</li> <li>• Optic nerve coloboma</li> <li>• Staphyloma</li> <li>• Megalopapillae</li> </ul>	<p><b>CLOVER LEAF</b></p> <p><b>Description:</b> Diagonal paracentral points show normal/near-normal sensitivity but all other points reduced. Typically due to patient responding normally at the start of the test only (these points tested first). Often accompanied by high fixation loss and false negatives.</p> <p><b>Differentials:</b></p> <ul style="list-style-type: none"> <li>• Inattention/malingering</li> <li>• Poor supervision</li> <li>• Retinal disease</li> </ul>

# CHAIR-SIDE REFERENCE: VISUAL FIELD ARTEFACTS

LENS SCOTOMA	LID SCOTOMA	LENS DEFOCUS
 <p><b>Description:</b> Absolute peripheral edge points of reduction arising from the patient's trial lens with near-normal sensitivity in adjacent locations.</p> <p><b>Steps to eliminate artefact:</b></p> <ul style="list-style-type: none"> <li>• Check trial lens placement from the patient's eye</li> <li>• Ensure patient forehead is correctly placed and the chin is situated on the chin rest</li> </ul>	 <p><b>Description:</b> A deep or absolute superior field defect, commonly arising from a droopy upper eyelid.</p> <p><b>Steps to eliminate artefact:</b></p> <ul style="list-style-type: none"> <li>• Perform lid taping or manually hold up the eyelid during testing.</li> </ul>	 <p><b>Description:</b> A generalised reduction in sensitivity values across the visual field arising from diotropic defocus when the incorrect trial lens is used. These defects are typically more diffuse and shallow compared to pathological loss. Similar to defects arising from media opacities such as cataracts or poor ocular surface.</p> <p><b>Steps to eliminate artefact:</b></p> <ul style="list-style-type: none"> <li>• Check trial lens has been calculated correctly from the patient's eye</li> </ul>
SEEDING POINT ERRORS	PHYSIOLOGICAL BLIND SPOT ABSENT	 <p><b>CFEH TELEHEALTH</b> SUPPORTING OPTOMETRISTS</p> <p>This reference is based on the current literature and evidence at the time of writing. This reference is designed a guide to aid diagnosis and management decisions however individual cases must be assessed in the context of all available clinical data. If you need additional advice or guidance, consider making a free telehealth appointment with a senior CFEH optometrist.</p> <p>CFEH telehealth services exist to support optometrists practicing in Australia in the areas of posterior disease diagnosis and management.</p> <p>To book a telehealth appointment, please go to the link below:</p> <p><a href="http://WWW.CENTREFOREYEHEALTH.COM.AU/TELEHEALTH">WWW.CENTREFOREYEHEALTH.COM.AU/TELEHEALTH</a></p>
 <p><b>Description:</b> Low sensitivity measurements at one or more of the four primary test locations (seeding points). This artefact is more common with shorter testing algorithms such as SITA-Faster.</p> <p><b>Steps to eliminate artefact:</b></p> <ul style="list-style-type: none"> <li>• Restart the test and remind the patient to respond when they see a stimulus.</li> </ul>	 <p><b>Description:</b> The absence of the physiological blind spot. This commonly arises from inadequate occlusion of the fellow eye or poor fixation during testing. This can be normal in patients with small optic nerves.</p> <p><b>Steps to eliminate artefact:</b></p> <ul style="list-style-type: none"> <li>• Check the fellow eye has been completely occluded.</li> <li>• Watch fixation and monitor for high false positives during testing.</li> </ul>	
A NOTE ON FRONTLOADING VISUAL FIELDS		
<p>With the introduction of shorter testing strategies such as SITA-Faster, clinicians are now able to perform more visual fields within the same amount of time. Frontloading fields involves performing multiple perimetric examinations (typically two) per eye per visit.</p> <p>Frontloading fields offers the following advantages:</p> <ul style="list-style-type: none"> <li>• Overcoming learning effects or low test reliability to reduce the number of visual fields required to confirm the true presence or absence of a field defect;</li> <li>• Meet the guidelines for recommended testing frequency at minimal time cost, especially in patients that are more prone to high variability; and</li> <li>• Detect progression earlier than non-frontloaded fields in both fast and slow progressors</li> </ul>		

# CHAIR-SIDE REFERENCE: VISUAL FIELD

## STRUCTURE/FUNCTION

The relationship between the retinal nerve fibre layer location and corresponding visual field is complex due to significant individual variations (Lamparter et al. 2013). The following shows a 'typical' structure/function relationship for the right eye adapted from Ferreras et al. 2008.

Note that atypical anatomical configurations such as **tilted discs** and **high refractive error** can change the structure-function relationship.

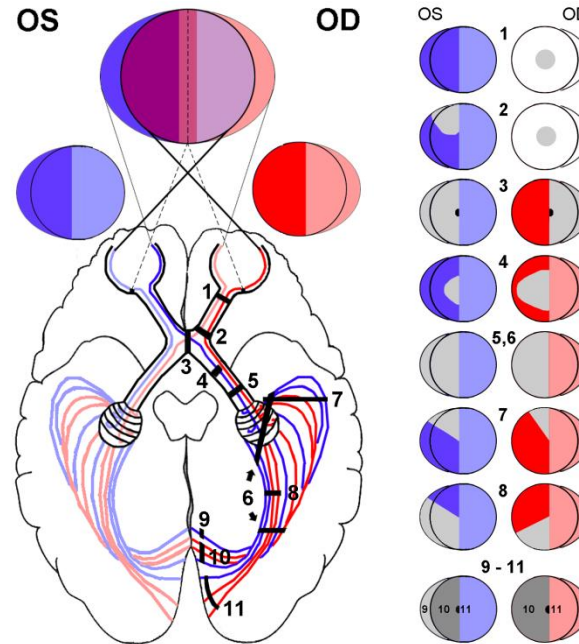

**Figure 1.** A map showing the relationship between RNFL sectors and test points on a 24-2 field test adapted from Ferreras et al. *IOVS* 2008.

## VISUAL PATHWAY

There are many ocular and neurological conditions that can lead to field defects with the following diagram showing the possible location of a visual pathway defect based on the pattern of field loss.

Note, however, that:

- field loss often does not precisely follow the pattern as outlined below;
- partial losses or losses that are not entirely symmetrical are common.

**Figure 2.** A diagram showing the visual pathway and field loss that may result from different injuries. Grey denotes scotoma on the right hand diagrams. (Zangerl et al *Clin Exp Optom* 2017)

## CLINICAL PEARLS

### RELIABILITY

- Unless there is a correlating structural finding, field defects **need to be repeatable** before they can be considered to be clinically significant due to large variability, especially in the periphery.
- **False positive errors** (>15% should be concerning) have a greater effect on visual field reliability than the fixation loss or false negative errors.
- Increased false negative errors are correlated with the severity of visual field loss, even with reliable visual field takers (Bengtsson and Heijl 2000) and thus **should not be used for assessing reliability in isolation**.
- **Blind-spot based fixation monitoring is generally ineffective**, and other forms of fixation monitoring such as gaze-monitoring and practitioner observation needs to be used instead

### VISUAL FIELD DEFECTS

- A visual field area with "complete loss" (e.g. <0dB) is not necessarily completely blind. A target with a greater luminance or size may still be visible
- Remember that checking the raw **sensitivity results** should be performed in conjunction with the **probability maps**: the former gives depth information whilst the later presents statistically significant anomalies and patterns of loss

### GLAUCOMA

- In glaucoma, **either structural loss or functional loss can occur first** depending on the sensitivity of the devices used to detect the loss (Keltner et al. 2006), i.e. do not rely solely on imaging for "pre-perimetric glaucoma"
- **Central field loss** may be seen in as many as 50% of glaucoma cases (Schiefer et al. 2010) and thus, a 10-2 field or equivalent may be useful
- 24-2 is designed for glaucoma assessment; if a non-glaucomatous defect, especially in neurological assessments, is suspected, utilise a 30-2 instead
