

CFEH Facebook Case #125

A 57 year old female with type 2 diabetes presented for a 12 month routine review. She claims to have good control of her diabetes and takes Diabex and Diamicron, however is unsure of her HbA1c or her blood glucose levels. She mentions that lately she has noticed numbness in her hands. Below are her images today and her images from 12 months ago. Her diabetic retinopathy has progressed significantly and there is non-macula retinal oedema present. She was referred back to her endocrinologist for review and possible discussion of Fenofibrate which may reduce retinopathy progression in patients with mild or moderate NPDR and Type 2 diabetes.
